

PROMPT HISTORY

Here's a summary of the **main prompts/questions I asked in this tab**:

- Asked for a detailed walkthrough of the API-key setup for the lab while using Google Colab.
- Asked what was happening in Part 3.1 – Component 1: Summarization, what you were supposed to learn, and what you were supposed to do.
- Asked to move to Part 3.2 – Structured Extraction (JSON) and understand what was happening there.
- Shared your Part 3.2 code and asked what errors were in it.
- Shared your extraction DataFrame and asked why the output was a table instead of JSON.
- Asked to move through Part 3.3 – Decision-Support Brief and understand it.
- Shared Part 3.4 – Commit Your Prompt Templates and asked what the section expected you to do.
- Shared your Colab screenshot and asked whether SUMMARY_PROMPT_V2 was the summary prompt that should be saved.
- Worked through Part 4.1 – Extraction Accuracy, including understanding how your extracted values are compared with GOLD.
- Worked through Part 4.2 – Reliability Testing, comparing repeated extraction at temperature 0 and 1.0.
- Worked through Part 4.3 – Hallucination Probing, including understanding what PASS/FAIL means.
- Shared your actual hallucination-test outputs and asked how they should be labelled and explained.
- Shared your actual API CompletionUsage so the cost-and-scale reflection could use your real token count.
- Shared a screenshot of Part 4.3 and asked why the output looked messy, which turned out to be because \n was being displayed literally in the recorded-results section.
